Dear CBSE Tech Team / Support,

I am a Class 12 student and an amateur programmer. While trying to apply for my answer sheet photocopy today, I noticed that the portal's payment window was crashing due to a minor initialization error in the frontend script.

Since I do some development work, I managed to track down the script glitch that causes the checkout variable to misfire(overrides the c function). To save your team some time, I have attached a text file containing a suggested fix for the integration code that resolves this initialization loop.

Hopefully, this helps your technical team patch it quickly so other students don't face payment drops!

I am sorry if this sounds rude, but i am also facing this issue, so I'm just trying to help.
and if possible please use multi port integration.

(PS. sorry to disturb at this time , didn't knew who to mail 🙏)

REGARDS,
PARTH
